

BANGALORE STRATEGIC SOLUTIONS

Internship Assessment

AI Automation Intern

Technical Assignment

Project: AI-Powered Email Generator

Time Allowed: 48 hours from receipt

Submission: Share a working link + your code

Confidential — Do not share outside this process

1. What This Assignment Is About

You are applying for an AI Automation Intern role at Bangalore Strategic Solutions (BSS), a contract staffing firm. Our recruiting team sends dozens of emails every day — to candidates, clients, and internal teams. Your task is to build a browser-based tool that uses an AI API to generate professional, ready-to-send emails from simple inputs.

This is not a theoretical exercise. We want something a recruiter could actually open on their laptop and use tomorrow. Design and build accordingly.

2. What You Need to Build

Build a browser-based tool (a single HTML file, or a hosted link) where the user provides the following inputs:

- Email Purpose — e.g., interview scheduling, offer follow-up, client update
- Recipient Name and Designation
- Key Points to Include — free-text or a list
- Tone — choose from: Professional, Friendly, Formal, Assertive

The tool should then generate:

- A complete, ready-to-send email body
- A subject line

2.1 Beyond the Basics

These features are required. They are not optional enhancements:

- **Regenerate & Refine:** Regenerate & Refine:
 - Add a “Regenerate” button and a short refinement text box (e.g., “make it shorter”, “add more urgency”). The model should incorporate the instruction and regenerate.
- **Quick-Start Templates:** Quick-Start Templates:
 - Offer a dropdown with at least 3 pre-built templates that auto-fill the form. Suggested: Interview Scheduling, Offer Letter Follow-up, Client Status Update.

- **Email Length Toggle:** Email Length Toggle:
 - Let the user choose between Concise (3–4 lines), Standard, or Detailed. The output should actually change — this is a prompt engineering challenge, not just a label.
- **Copy-to-Clipboard:** Copy-to-Clipboard:
 - One-click copy. Output must have clean paragraph formatting, not raw line breaks.

3. Example Input & Expected Output

Sample Input

Purpose: Interview Scheduling

Recipient: Rahul Sharma, Senior Developer

Key Points: Monday interview, 11 AM, Microsoft Teams link to follow

Tone: Professional

Length: Concise

The output should be a short, well-structured email with a subject line, proper greeting, the key information clearly stated, and a professional sign-off. It should not sound like a template. It should sound like a person wrote it.

4. How We Will Evaluate Your Submission

We will review your submission across the following areas:

Area	What We're Looking For	Weight
AI Output Quality	Does the email sound human, professional, and context-aware?	25%
Prompt Engineering	How well did you instruct the model? Show us your system prompt.	25%
UI / Usability	Can a non-technical recruiter use this without any guidance?	20%

Area	What We're Looking For	Weight
Edge Case Handling	What happens with empty inputs, vague purpose, or missing fields?	15%
Code Quality	Is the code readable, structured, and commented?	10%
Bonus	Did you think of anything we didn't ask for?	5%

We will also ask you to walk us through your submission in a short call — roughly 10 minutes. You should be ready to explain one design decision you made, one trade off you encountered, and one thing you would improve given more time.

Important: Show us your system prompt. Paste it in a README or in a comment in your code. This is the single most revealing part of the assignment.

5. Constraints & Rules

- You may use any AI API — OpenAI, Anthropic, Gemini, or any other. Mention which one and why.
- The tool must run in a browser. No installs, no Python scripts, no local servers.
- You may use any frontend framework or plain HTML/JS — your choice.
- Do not use a UI template or a no-code builder. We want to see your code.
- Keep your API key out of your submitted code. Use an environment variable or a config file that is not committed.
- You have 48 hours from the time you receive this document.

6. How to Submit

1. Share a working link to your tool (GitHub Pages, Vercel, Netlify, or similar).
2. Share your code (GitHub repo link, or a zip file).
3. Include a short README (even just a paragraph) covering which API you used, what your system prompt does, and any known limitations.
4. Reply to the email this assignment came from with all the above.

7. What Good Looks Like

We are not looking for perfection. We are looking for judgment. Specifically:

- A recruiter who has never seen this tool before can use it without any instructions from you.
- The generated emails are specific, not generic. They use the inputs provided, not filler text.
- The refinement feature actually changes the output meaningfully — not just rewrites the same thing.
- You have thought about what happens when someone clicks Generate with half the fields empty.
- Your code is clean enough that someone else could read and modify it.

A note from the team: *We review dozens of assignments. The ones that stand out are not the most feature-rich — they are the ones where it is obvious the candidate thought about the end user. Build for a recruiter, not for a demo.*
